Revision History

| Date | Revision | Description |
|---------------|----------|--|
| December 2019 | 1.0 | Initial release. |
| May 2020 | 2.0 | Additional command line examples. |
| December 2020 | 3.0 | Added Restrictions section (2.3) and Tiger Lake support |
| January 2021 | 4.0 | Additional Tiger Lake support |
| October 2021 | 5.0 | Fixed issue: "49-Error: A Platform condition has prevented executing", caused by some Crucial memory SO-DIMMs. |

1.0 *Introduction*

Intel® Aptio® V Integrator Tools are designed to assist integrators (who usually work in manufacturing or enterprise environment) with the process of BIOS/SMBIOS customization, OEM Windows® product key injection (OEM Activation 3.0, OA3), changing the Logo, etc. of Intel® NUC AptioV based products.

All Aptio V Integrator Tools are available on [Download Center](#).

The table describes the purpose of each of the Tools.

| Tool | Description |
|-----------|--|
| iFlashV | iFlashV is a command line tool that allows you to: <ul style="list-style-type: none">• Update the system BIOS• Update a logo image• Insert a specific OEM activation key |
| iDmiEdit | iDmiEdit (Desktop Management Interface Edit) allows you to modify strings associated with SMBIOS tables. |
| iCHLogo | iCHLogo allows you to replace the default Intel logo image with a custom image. |
| iSetupCfg | iSetupCfg is a command line tool which provides you an easy way to update NVRAM variables from within the EFI, Linux®, or Windows®-based environment. You can: <ul style="list-style-type: none">• Extract variables directly from the BIOS.• Change settings using a text editor and then update the BIOS with the custom settings. |

2.0 *iSetupCfg User Guide*

2.1 Overview

iSetupCfg allows you to update BIOS settings from within the Windows, EFI shell or Linux environment. You can extract current settings directly from the BIOS, change them using either a text editor or a setup program, and then update the BIOS with the new settings. Each of these actions may take place on a different system.

iSetupCfg produces a script file that lists all setup questions on the system where iSetupCfg is running. You can then modify the script file and use it as input to change the current BIOS settings.

2.2 Features

The iSetupCfg tool allows you to perform the following functions:

- Read BIOS settings at run time to config files that may be edited as text
- Load a script file created by the above process and update a target system with custom BIOS
- Enables advanced scripting mode that presents data as setup questions and associated settings
- Enables advanced scripting mode to update setup question defaults
- Provides Command line operation
- Support to export only questions whose value is different from default
- Supports suppression of duplicate questions
- Unlocks protected variable update with administrator password
- Support to change user/admin password
- Aptio V BIOS Identification
- Supports managing duplicate/unmatched setup questions
- Supports Migration of Settings
- Boot order synchronization
- UEFI spec support

2.3 Restrictions

Options under the following BIOS menus can't be modified using iSetupCfg:

- Performance page
- Secure Boot page
- Add-In Config page
- BIOS Password, Hard Drive Password and TCG Storage Security Password

2.4 Requirements

2.4.1 Supported Operating Systems

| | |
|------------------------------|--|
| iSetupCfg for Windows | <ul style="list-style-type: none">iSetupCfgWin32.exe is supported on Windows 32-bit operating systems. It requires the Windows platform driver amifldrv32.sys and amigendrv32.sys.iSetupCfgWin64.exe is supported on Windows 64-bit operating systems. It requires the Windows platform driver amifldrv64.sys and amigendrv64.sys. <p>iSetupCfg for Windows must be run from a Command Prompt in Administrator mode:</p> <ol style="list-style-type: none">1. Click the Windows button and type Command Prompt.2. Right-click on Command Prompt and select Run as Administrator. |
| iSetupCfg for EFI | <ul style="list-style-type: none">iSetupCfgEfi32.efi is supported in EFI shell.iSetupCfgEfi64.efi: is supported in EFIx64 shell. |
| iSetupCfg for Linux | <ul style="list-style-type: none">iSetupCfgLnx32 is supported in Linux 32-bit operating systems.iSetupCfgLnx64 is supported in Linux 64-bit operating systems. |

2.4.2 BIOS Security Settings

For security reasons, a BIOS Admin/Supervisor password is required to make changes to BIOS settings using the iSetupCfg tool.

If you have a password installed, you can include the password in the iSetupCfg commands using the /cpwd command line switch. Example: **/cpwd 123456**

If you don't have a password installed, follow these steps:

1. Press **F2** during boot to enter BIOS setup.
2. Go to **Security > Security Features**.
3. Set **iSetupCfg Password Check to Bypass**. This allows you to pass a 'dummy' password using the command line switch **/cpwd admin**.
4. Press **F10** to save and exit BIOS Setup.

2.5 iSetupCFG Usage

2.5.1 Command Line Switches

| Switch | Description |
|--------|--|
| /i | Indicates the input of variable. Example: BIOS Capsule filename input: /i FN0039.cap |
| /o | Indicates the output of variable. Example: BIOS Capsule filename output: /o FN0039Custom.cap |
| /s | Indicates a script file |
| /q | Indicates Quiet mode to suppress all warning messages |
| /ds | Indicates the values can be set as BIOS Standard Default Values |
| /b | Enables the export and import of boot order controls |
| /cpwd | Validates the current Supervisor password and unlocks the protected variables update |
| /apwd | Sets a new Supervisor password |
| /upwd | Sets a new User password |
| /ms | Indicates Map String of the Setup Question |
| /qv | Indicates Question Value to be set for the Setup Question |
| /ndef | Export only those settings whose current value is different from the default |

2.5.2 Export All BIOS Settings

Exporting values to a text file provides details about every BIOS setting, including the map string and current value. You'll need to know the map strings of the options you wish to change.

Example command line to export all BIOS settings to a text file.

| OS / Environment | Command Syntax |
|------------------|---------------------------------------|
| Windows 64-bit | iSetupCfgWin64.exe /o /s filename.txt |
| Windows 32-bit | iSetupCfgWin32.exe /o /s filename.txt |
| EFI shell 32-bit | iSetupCfgEfi32.efi /o /s filename.txt |
| EFI shell 64-bit | iSetupCfgEfi64.efi /o /s filename.txt |
| Linux 64-bit | iSetupCfgLnx64 /o /s filename.txt |
| Linux 32-bit | iSetupCfgLnx32 /o /s filename.txt |

The BIOS settings in the resulting text file appear as in the following example:

```
Setup Question = Hard Disk Pre-Delay
Map String      = SPG01A
Token          =1D // Do NOT change this line
Offset          =792
Width          =01
BIOS Default    =<0>
Value          =<0>
```

2.5.3 Get the Current Map String Value of a Single BIOS Option

Example command line to return the value of a single BIOS option.

| OS / Environment | Command Syntax |
|------------------|----------------------------------|
| Windows 64-bit | iSetupCfgWin64.exe /o /ms SPG01A |
| Windows 32-bit | iSetupCfgWin32.exe /o /ms SPG01A |
| EFI shell 32-bit | iSetupCfgEfi32.efi /o /ms SPG01A |
| EFI shell 64-bit | iSetupCfgEfi64.efi /o /ms SPG01A |
| Linux 64-bit | iSetupCfgLnx64 /o /ms SPG01A |
| Linux 32-bit | iSetupCfgLnx32 /o /ms SPG01A |

The example above returns the value of the Map String SPG01A (Hard Disk Pre-Delay):

Value =<0>

2.5.4 Update a Single BIOS Option

This feature allows to update single setup questions from command line without using a script file. It makes use of the mapping language string to uniquely identify the question. The command line usage is shown below:

| OS / Environment | Command Syntax |
|------------------|---|
| Windows 64-bit | iSetupCfgWin64.exe /i /cpwd <current supervisor password> /ms <question map string> /qv <question value> [/q] [/ds] |
| Windows 32-bit | iSetupCfgWin32.exe /i /cpwd <current supervisor password> /ms <question map string> /qv <question value> [/q] [/ds] |
| EFI shell 32-bit | iSetupCfgEfi32.efi /i /cpwd <current supervisor password> /ms <question map string> /qv <question value> [/q] [/ds] |
| EFI shell 64-bit | iSetupCfgEfi64.efi /i /cpwd <current supervisor password> /ms <question map string> /qv <question value> [/q] [/ds] |
| Linux 64-bit | iSetupCfgLnx64 /i /cpwd <current supervisor password> /ms <question map string> /qv <question value> [/q] [/ds] |
| Linux 32-bit | iSetupCfgLnx32 /i /cpwd <current supervisor password> /ms <question map string> /qv <question value> [/q] [/ds] |

Examples of single question updates

Boot Order question: The question value should be a comma separated list of boot devices where each boot device is represented using the unique number assigned to it in the UEFI boot order. The list should contain all devices in the current boot order.

| OS / Environment | Command Syntax |
|------------------|--|
| Windows 64-bit | iSetupCfgWin64.exe /i /ms SETUP006 /qv 0x0002,0x0001 |
| Windows 32-bit | iSetupCfgWin32.exe /i /ms SETUP006 /qv 0x0002,0x0001 |
| EFI shell 32-bit | iSetupCfgEfi32.efi /i /ms SETUP006 /qv 0x0002,0x0001 |
| EFI shell 64-bit | iSetupCfgEfi64.efi /i /ms SETUP006 /qv 0x0002,0x0001 |
| Linux 64-bit | iSetupCfgLnx64 /i /ms SETUP006 /qv 0x0002,0x0001 |
| Linux 32-bit | iSetupCfgLnx32 /i /ms SETUP006 /qv 0x0002,0x0001 |

Numeric question: The question value represents the new value. This should be within the valid range.

| OS / Environment | Command Syntax |
|------------------|---|
| Windows 64-bit | iSetupCfgWin64.exe /i /cpwd <supervisor password. /ms SETUP004 /qv 0x09 |
| Windows 32-bit | iSetupCfgWin32.exe /i /cpwd <supervisor password. /ms SETUP004 /qv 0x09 |
| EFI shell 32-bit | iSetupCfgEfi32.efi /i /cpwd <supervisor password. /ms SETUP004 /qv 0x09 |
| EFI shell 64-bit | iSetupCfgEfi64.efi /i /cpwd <supervisor password. /ms SETUP004 /qv 0x09 |
| Linux 64-bit | iSetupCfgLnx64 /i /cpwd <supervisor password. /ms SETUP004 /qv 0x09 |
| Linux 32-bit | iSetupCfgLnx32 /i /cpwd <supervisor password. /ms SETUP004 /qv 0x09 |

Checkbox question: The question value should be either 0 or 1.

| OS / Environment | Command Syntax |
|------------------|---|
| Windows 64-bit | iSetupCfgWin64.exe /i /cpwd <supervisor password. /ms SETUP005 /qv 0x01 |
| Windows 32-bit | iSetupCfgWin32.exe /i /cpwd <supervisor password. /ms SETUP005 /qv 0x01 |
| EFI shell 32-bit | iSetupCfgEfi32.efi /i /cpwd <supervisor password. /ms SETUP005 /qv 0x01 |
| EFI shell 64-bit | iSetupCfgEfi64.efi /i /cpwd <supervisor password. /ms SETUP005 /qv 0x01 |
| Linux 64-bit | iSetupCfgLnx64 /i /cpwd <supervisor password. /ms SETUP005 /qv 0x01 |
| Linux 32-bit | iSetupCfgLnx32 /i /cpwd <supervisor password. /ms SETUP005 /qv 0x01 |

One-of question: The question value represents the index of the option in the list of options.

| OS / Environment | Command Syntax |
|------------------|---|
| Windows 64-bit | iSetupCfgWin64.exe /i /cpwd <supervisor password. /ms SETUP006 /qv 0x02 |
| Windows 32-bit | iSetupCfgWin32.exe /i /cpwd <supervisor password. /ms SETUP006 /qv 0x02 |
| EFI shell 32-bit | iSetupCfgEfi32.efi /i /cpwd <supervisor password. /ms SETUP006 /qv 0x02 |
| EFI shell 64-bit | iSetupCfgEfi64.efi /i /cpwd <supervisor password. /ms SETUP006 /qv 0x02 |
| Linux 64-bit | iSetupCfgLnx64 /i /cpwd <supervisor password. /ms SETUP006 /qv 0x02 |
| Linux 32-bit | iSetupCfgLnx32 /i /cpwd <supervisor password. /ms SETUP006 /qv 0x02 |

2.5.5 Script File for Updating Multiple BIOS Options

From the command line, execute iSetupCfg using the following command to output all BIOS settings to a script file.

| OS / Environment | Command Syntax |
|------------------|---|
| Windows 64-bit | iSetupCfgWin64.exe /o /s script-filename.txt [/b] |
| Windows 32-bit | iSetupCfgWin32.exe /o /s script-filename.txt [/b] |
| EFI shell 32-bit | iSetupCfgEfi32.efi /o /s script-filename.txt [/b] |
| EFI shell 64-bit | iSetupCfgEfi64.efi /o /s script-filename.txt [/b] |
| Linux 64-bit | iSetupCfgLnx64 /o /s script-filename.txt [/b] |
| Linux 32-bit | iSetupCfgLnx32 /o /s script-filename.txt [/b] |

The default export behavior without the **/b** option is to NOT export boot order controls. To enable exporting of boot order controls, include the **/b** option.

Open the script file in a text editor and modify the desired BIOS setting values and save the modifications. You can remove any setup questions that you do not wish to update.

After editing the file, execute the following command to upload the changed settings from the script file:

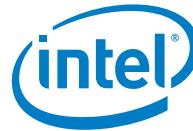

| OS / Environment | Command Syntax |
|------------------|--|
| Windows 64-bit | iSetupCfgWin64.exe /i /cpwd <supervisor password> /s script-filename.txt [/ds] [/b] [/q] |
| Windows 32-bit | iSetupCfgWin32.exe /i /cpwd <supervisor password> /s script-filename.txt [/ds] [/b] [/q] |
| EFI shell 32-bit | iSetupCfgEfi32.efi /i /cpwd <supervisor password> /s script-filename.txt [/ds] [/b] [/q] |
| EFI shell 64-bit | iSetupCfgEfi64.efi /i /cpwd <supervisor password> /s script-filename.txt [/ds] [/b] [/q] |
| Linux 64-bit | iSetupCfgLnx64 /i /cpwd <supervisor password> /s script-filename.txt [/ds] [/b] [/q] |
| Linux 32-bit | iSetupCfgLnx32 /i /cpwd <supervisor password> /s script-filename.txt [/ds] [/b] [/q] |

2.5.6 Change User/Admin Password

iSetupCfg supports changing the user and admin passwords for BIOS setup. The current admin password must be provided using /cpwd.

To change the Supervisor password:

| OS / Environment | Command Syntax |
|------------------|--|
| Windows 64-bit | iSetupCfgWin64.exe /cpwd <current supervisor password> /apwd <new supervisor password> |
| Windows 32-bit | iSetupCfgWin32.exe /cpwd <current supervisor password> /apwd <new supervisor password> |
| EFI shell 32-bit | iSetupCfgEfi32.efi /cpwd <current supervisor password> /apwd <new supervisor password> |
| EFI shell 64-bit | iSetupCfgEfi64.efi /cpwd <current supervisor password> /apwd <new supervisor password> |

| | |
|--------------|--|
| Linux 64-bit | iSetupCfgLnx64 /cpwd <current supervisor password> /apwd <new supervisor password> |
| Linux 32-bit | iSetupCfgLnx32 /cpwd <current supervisor password> /apwd <new supervisor password> |

To change the User password:

| OS / Environment | Command Syntax |
|------------------|--|
| Windows 64-bit | iSetupCfgWin64.exe /cpwd <current supervisor password> /upwd <new user password> |
| Windows 32-bit | iSetupCfgWin32.exe /cpwd <current supervisor password> /upwd <new user password> |
| EFI shell 32-bit | iSetupCfgEfi32.efi /cpwd <current supervisor password> /upwd <new user password> |
| EFI shell 64-bit | iSetupCfgEfi64.efi /cpwd <current supervisor password> /upwd <new user password> |
| Linux 64-bit | iSetupCfgLnx64 /cpwd <current supervisor password> /upwd <new user password> |
| Linux 32-bit | iSetupCfgLnx32 /cpwd <current supervisor password> /upwd <new user password> |

To change the Supervisor and User password:

| OS / Environment | Command Syntax |
|------------------|--|
| Windows 64-bit | iSetupCfgWin64.exe /cpwd <current supervisor password> /apwd <new supervisor password> /upwd <new user password> |
| Windows 32-bit | iSetupCfgWin32.exe /cpwd <current supervisor password> /apwd <new supervisor password> /upwd <new user password> |
| EFI shell 32-bit | iSetupCfgEfi32.efi /cpwd <current supervisor password> /apwd <new supervisor password> /upwd <new user password> |
| EFI shell 64-bit | iSetupCfgEfi64.efi /cpwd <current supervisor password> /apwd <new supervisor password> /upwd <new user password> |
| Linux 64-bit | iSetupCfgLnx64 /cpwd <current supervisor password> /apwd <new supervisor password> /upwd <new user password> |
| Linux 32-bit | iSetupCfgLnx32 /cpwd <current supervisor password> /apwd <new supervisor password> /upwd <new user password> |

2.1 iSetupCfg Error Codes

| Error | Description |
|--|---|
| Error in writing variable Setup to NVRAM | Check if you need to include a supervisor password with the /cpwd command line switch. See Section 2.3.2. |
